

Data Collection and Preprocessing Phase

Date	19 June 2025
Team ID	SWTID1749908722
Project Title	CardMaster: Intelligent Playing Card Recognition using Transfer Learning
Maximum Marks	2 Marks

Data Collection Plan & Raw Data Sources Identification

The **CardMaster** project is designed to recognize and classify playing cards from images using transfer learning. The objective is to develop an image classification model capable of identifying the suit and rank of playing cards from real-world images. This helps automate card recognition in digital games, augmented reality applications, and accessibility solutions.

Data Collection Plan

Section	Description
Project Overview	The CardMaster project is a deep-learning based image classification system designed to recognize playing cards from images using transfer learning. The goal is to accurately detect both the rank and suit of each card to facilitate automated recognition in games
Data Collection Plan	For this project, we used a publicly available Kaggle dataset containing labeled images of standard playing cards. The dataset includes high-resolution images of all 53 cards across four suits (Hearts, Diamonds, Clubs, Spades) and thirteen ranks (Ace through King) and joker .

Raw Data Sources Identified	The raw data used in the CardMaster project comes from a Kaggle dataset. The images in the dataset are high-resolution and captured under varying lighting conditions, angles, and backgrounds, making it ideal for training a robust deep learning model using transfer learning. The dataset is structured into folders, each named according to the card class (e.g., AS for Ace of Spades, 10H for Ten of Hearts), simplifying supervised learning tasks.
